

CS 247 – Scientific Visualization Lecture 18: Volume Visualization, Pt. 5

Markus Hadwiger, KAUST

Reading Assignment #10 (until Apr 13)

Read (required):

- Real-Time Volume Graphics, Chapter 7 (GPU-Based Ray Casting)
- Real-Time Volume Graphics, Chapter 4.5 4.8

Quiz #2: Apr 13

Organization

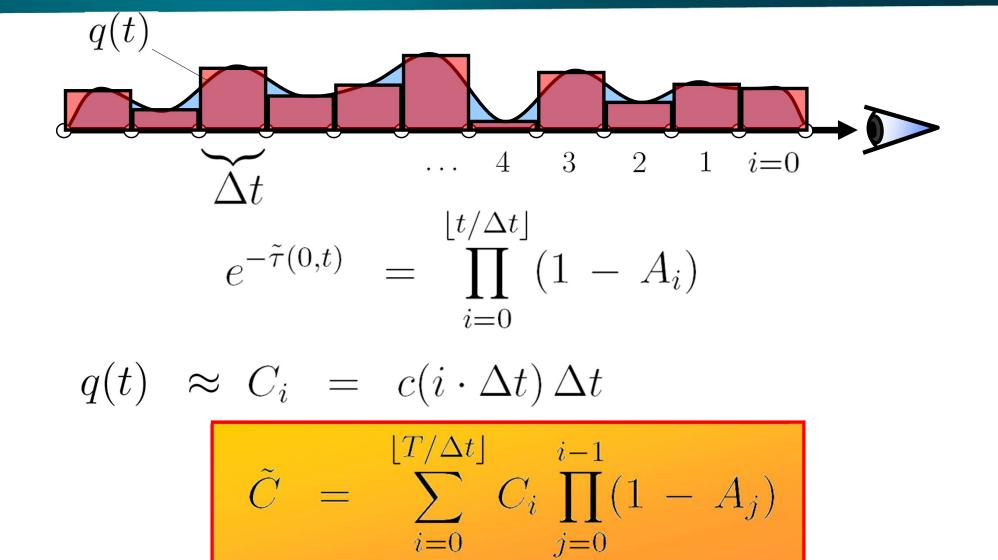

- First 30 min of lecture
- No material (book, notes, ...) allowed

Content of questions

- Lectures (both actual lectures and slides)
- Reading assignments (except optional ones)
- Programming assignments (algorithms, methods)
- Solve short practical examples

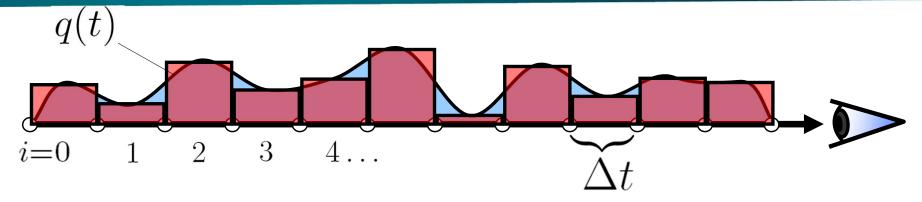

Volume Rendering

can be computed iteratively/recursively!

Note: we just changed the convention from i=0 is at the front of the volume (previous slides) to i=0 is at the back of the volume! can be computed iteratively/recursively:

$$C'_{i} = C_{i} + (1 - A_{i})C'_{i-1}$$

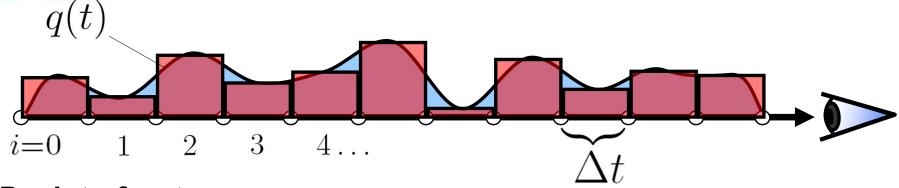

Radiant energy observed at position *i*

Radiant energy emitted at position *i*

Absorption at position *i*

Radiant energy observed at position *i–1*

Back-to-front compositing

$$C'_i = C_i + (1 - A_i)C'_{i-1}$$

iterate from *i*=0 (back) to *i*=max (front): *i* increases

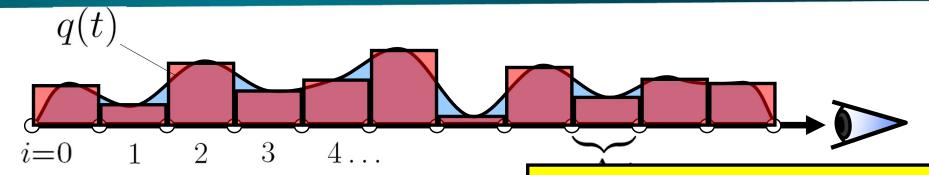

Front-to-back compositing

$$C'_{i} = C'_{i+1} + (1 - A'_{i+1})C_{i}$$

$$A_i' = A_{i+1}' + (1 - A_{i+1}')A_i$$

iterate from *i*=max (front) to *i*=0 (back) : *i* decreases

Back-to-front compositing

 $C_i' = C_i + (1$

iterate from i=0 (back

Front-to-back compositing

Early Ray Termination:
Stop the calculation when

$$A_i' \approx 1$$

$$C'_{i} = C'_{i+1} + \underbrace{(1 - A'_{i+1})}_{C_{i}} C_{i}$$

 $A'_{i} = A'_{i+1} + (1 - A'_{i+1}) A_{i}$

iterate from *i*=max (front) to *i*=0 (back) : *i* decreases

Volume Rendering Integral

Volume rendering integral for *Emission Absorption* model

$$I(s) = I(s_0) e^{-\tau(s_0,s)} + \int_{s_0}^{s} q(\tilde{s}) e^{-\tau(\tilde{s},s)} d\tilde{s}$$

 $\tau(s_1, s_2) = \int_{s_1}^{s_2} \kappa(s) ds.$

Iterative/recursive numerical solutions:

Back-to-front compositing

$$C'_i = C_i + (1 - A_i)C'_{i-1}$$

Front-to-back compositing

$$C'_{i} = C'_{i+1} + (1 - A'_{i+1})C_{i}$$

 $A'_{i} = A'_{i+1} + (1 - A'_{i+1})A_{i}$

here, all colors are associated colors!

Opacity Correction

Opacity Correction

Simple compositing only works as far as the opacity values are correct... and they depend on the sample distance!

$$T_i = e^{-\int_{s_i}^{s_i + \Delta t} \kappa(t) dt} \approx e^{-\kappa(s_i)\Delta t} = e^{-\kappa_i \Delta t}$$

$$A_i = 1 - e^{-\kappa_i \Delta t} \qquad \qquad \tilde{T}_i = T_i^{\left(\frac{\Delta t}{\Delta t}\right)}$$

$$\tilde{A}_i = 1 - (1 - A_i)^{\left(\frac{\Delta \tilde{t}}{\Delta t}\right)}$$

opacity correction formula

Beware that usually this is done *for each different scalar value* (every transfer function entry), not actually at spatial positions/intervals *i*

Associated Colors

Associated (or "opacity-weighted" colors) are often used in compositing equations

Every color is *pre-multiplied* by its corresponding opacity

$$\begin{pmatrix}
R \\
G \\
B \\
A
\end{pmatrix}
\qquad \Rightarrow
\begin{pmatrix}
R*A \\
G*A \\
B*A \\
A
\end{pmatrix}$$

Our compositing equations assume associated colors!

Important: After opacity-correction, all associated colors must be updated! (or combined/multiplied correctly on-the-fly!)

Standard emission-absorption optical model

- Only one kind of particle: the same particles that absorb light, emit light
- Aha! Therefore lower absorption means lower emission as well

$$C_i = \frac{q_i}{\kappa_i} \left(1 - e^{-\kappa_i \Delta t} \right) = \hat{C}_i A_i$$

$$q_i := \hat{C}_i \kappa_i$$
 $\lim_{\kappa_i \to 0} q_i \frac{\left(1 - e^{-\kappa_i \Delta t}\right)}{\kappa_i} = \lim_{\kappa_i \to 0} \hat{C}_i \left(1 - e^{-\kappa_i \Delta t}\right) = 0$
 $A_i := 1 - e^{-\kappa_i \Delta t}$
 $\lim_{\kappa_i \to \infty} q_i \frac{\left(1 - e^{-\kappa_i \Delta t}\right)}{\kappa_i} = \lim_{\kappa_i \to \infty} \hat{C}_i \left(1 - e^{-\kappa_i \Delta t}\right) = \hat{C}_i$

Standard emission-absorption optical model

Ray setup

Loop over ray

Resample scalar value

Classification

Shading

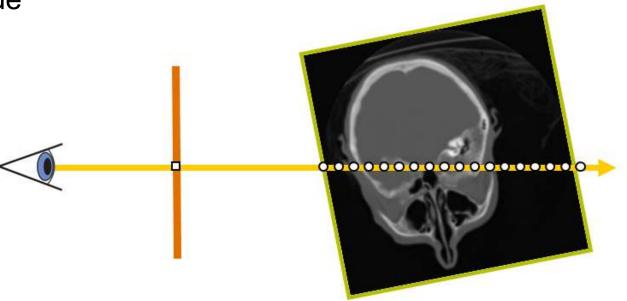

Ray setup

Loop over ray

Resample scalar value

Classification

Shading

Ray Setup

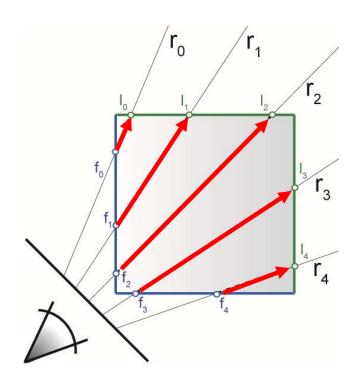

Two main approaches:

- Procedural ray/box intersection [Röttger et al., 2003], [Green, 2004]
- Rasterize bounding box [Krüger and Westermann, 2003]

Some possibilities

- Ray start position and exit check
- Ray start position and exit position
- Ray start position and direction vector

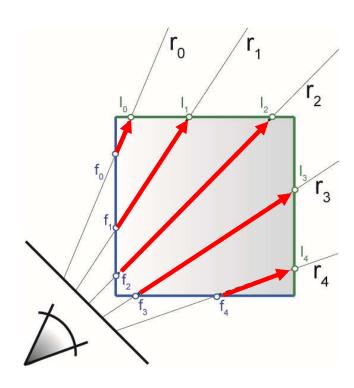

Procedural Ray Setup/Termination

- Everything handled in the fragment shader / CUDA kernel
- Procedural ray / bounding box intersection
- Ray is given by camera position and volume entry position
- Exit criterion needed

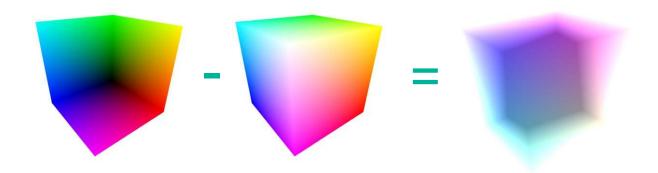

- Pro: simple and self-contained
- Con: full computational load per-pixel/fragment

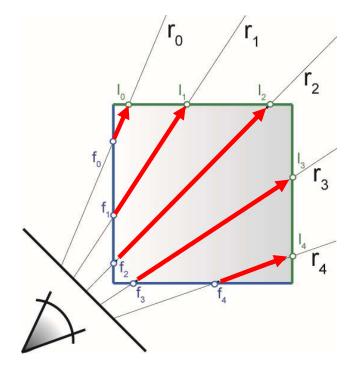

Rasterization-Based Ray Setup

- Fragment == ray
- Need ray start pos, direction vector
- Rasterize bounding box

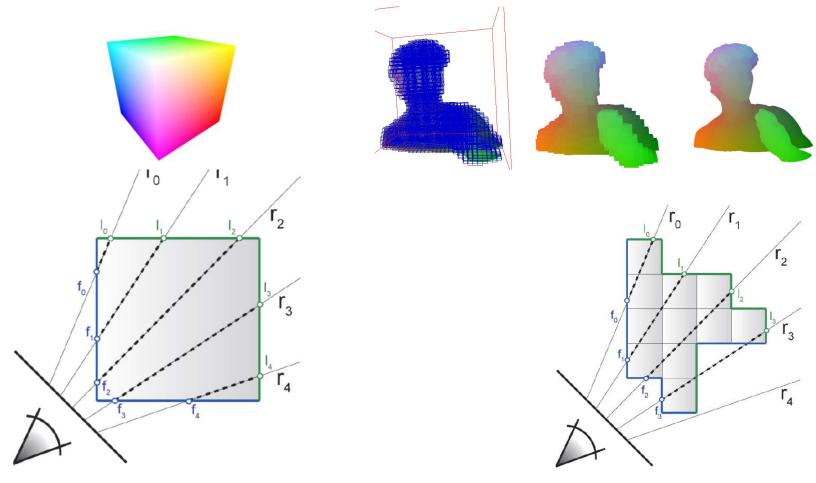

Identical for orthogonal and perspective projection!

Object-Order Empty Space Skipping

Modify initial rasterization step

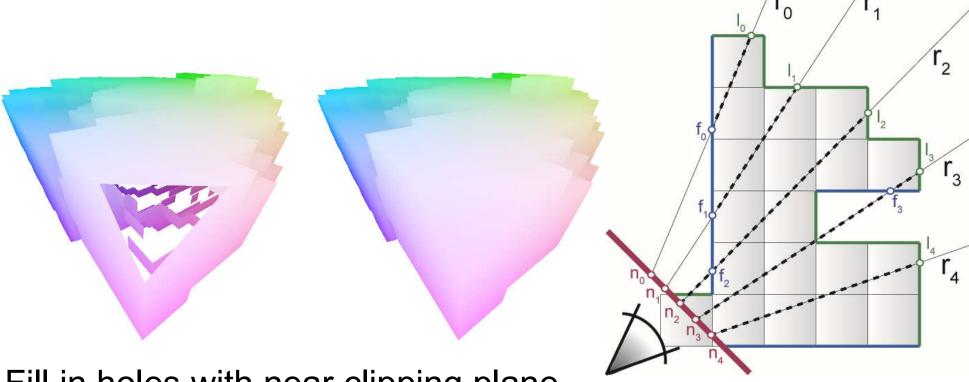

rasterize bounding box

rasterize "tight" bounding geometry

Moving Into The Volume

Near clipping plane clips into front faces

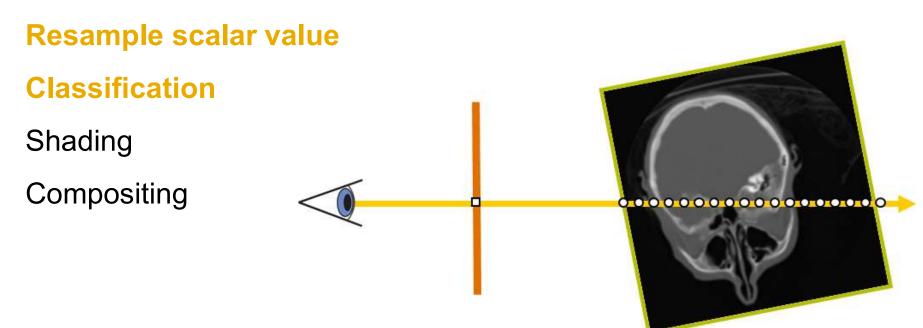

Fill in holes with near clipping plane

Can use depth buffer [Scharsach et al., 2006]

Ray setup

Loop over ray

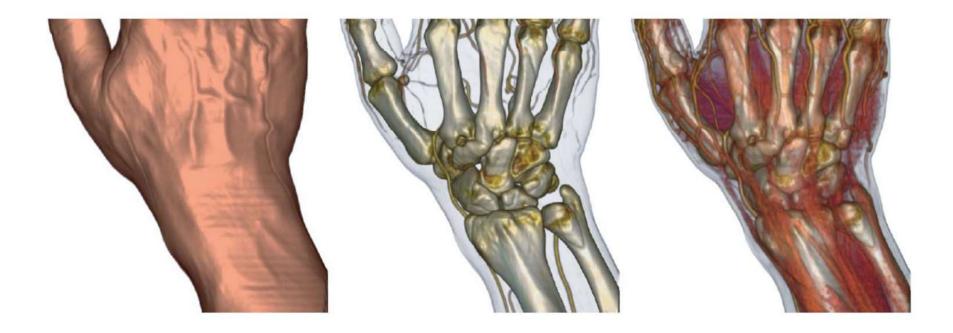

Classification – Transfer Functions

During Classification the user defines the "look" of the data.

- Which parts are transparent?
- Which parts have what color?

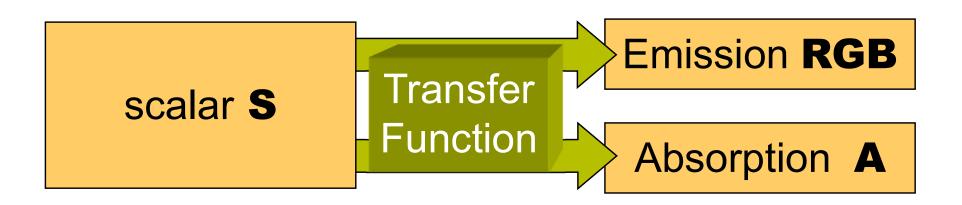

Classification – Transfer Functions

During Classification the user defines the "look" of the data.

- Which parts are transparent?
- Which parts have what color?

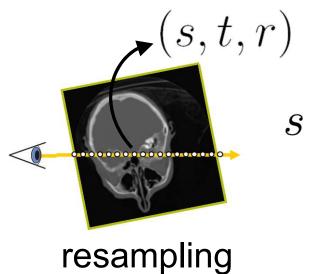

The user defines a *transfer function*.

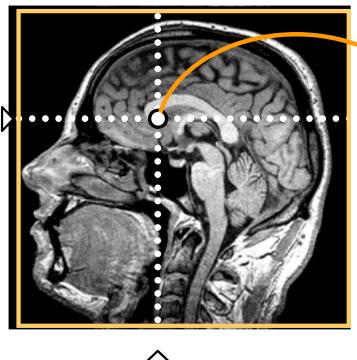

1D Transfer Functions

texture = scalar field

scalar value S

T(S)

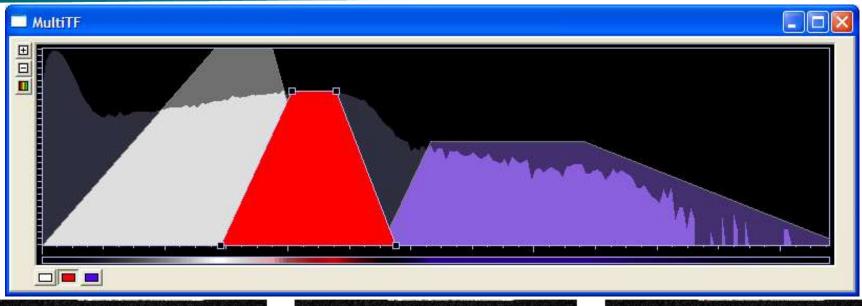

RGBA

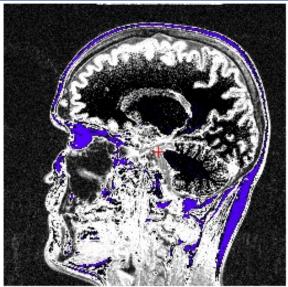

transferfunction texture = [Emission RGB, Absorption A]

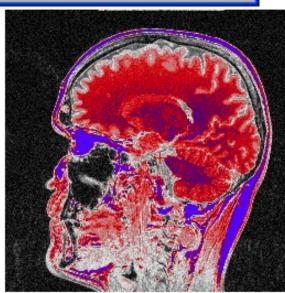

1D Transfer Functions

Applying Transfer Function: Cg Example

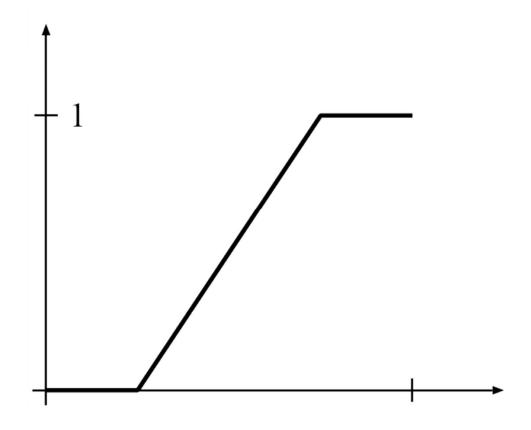

```
// Cg fragment program for post-classification
// using 3D textures
float4 main (float3 texUV : TEXCOORD0,
            uniform sampler3D volume texture,
            uniform sampler1D transfer function) :
  COLOR
   float index = tex3D(volume texture, texUV);
   float4 result = tex1D(transfer function, index);
   return result;
```

Windowing Transfer Function

Map input scalar range to output intensity range

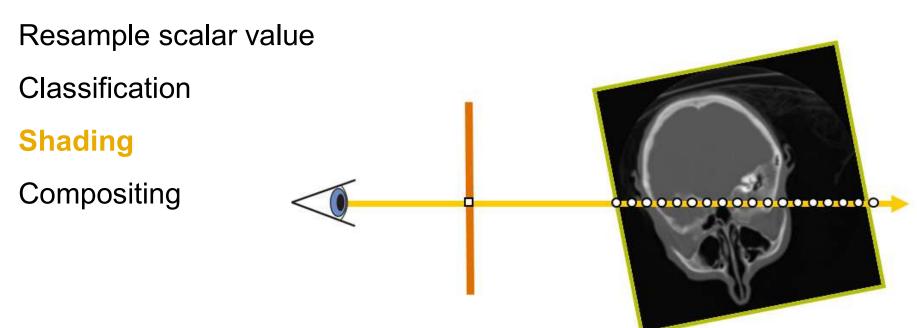

- Select scalar range of interest
- Adjust contrast

Ray setup

Loop over ray

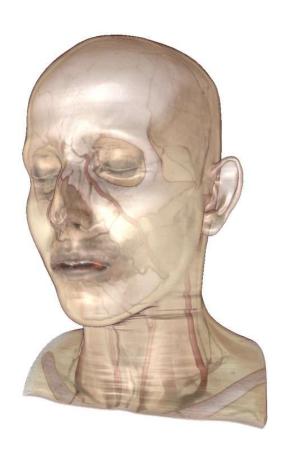

Volume Shading

Local illumination vs. global illumination

- Gradient-based or gradient-less
- Shadows, (multiple) scattering, ...

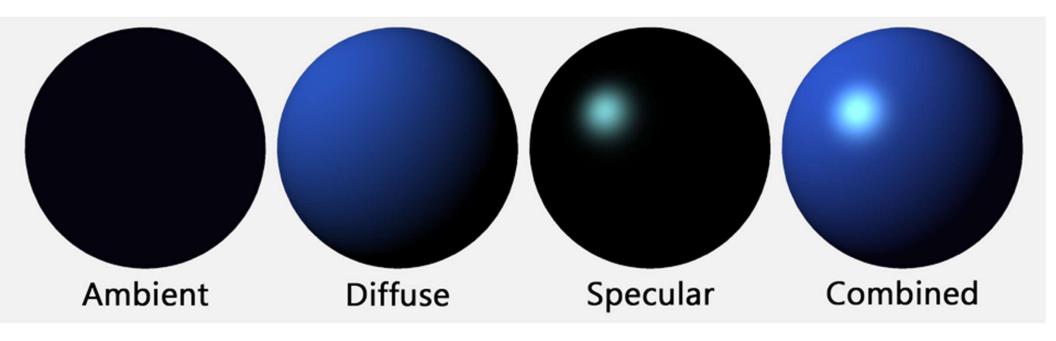

Local Illumination Model: Phong Lighting Model

$$\mathbf{I}_{\mathrm{Phong}} = \mathbf{I}_{\mathrm{ambient}} + \mathbf{I}_{\mathrm{diffuse}} + \mathbf{I}_{\mathrm{specular}}$$

On-the-fly Gradient Estimation

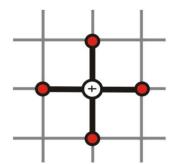

$$\nabla f(x, y, z) \approx \frac{1}{2h} \begin{pmatrix} f(x+h, y, z) - f(x-h, y, z) \\ f(x, y+h, z) - f(x, y-h, z) \\ f(x, y, z+h) - f(x, y, z-h) \end{pmatrix}$$

```
float3 sample1, sample2;
// six texture samples for the gradient
sample1.x = tex3D(texture,uvw-half3(DELTA,0.0,0.0)).x;
sample2.x = tex3D(texture,uvw+half3(DELTA,0.0,0.0)).x;
sample1.y = tex3D(texture,uvw-half3(0.0,DELTA,0.0)).x;
sample2.y = tex3D(texture,uvw+half3(0.0,DELTA,0.0)).x;
sample1.z = tex3D(texture,uvw-half3(0.0,0.0,DELTA)).x;
sample2.z = tex3D(texture,uvw+half3(0.0,0.0,DELTA)).x;
// central difference and normalization
float3 N = normalize(sample2-sample1);
```

On-The-Fly Gradients

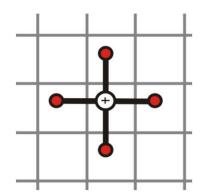

Reduce texture memory consumption!

Central differences before and after linear interpolation of values at grid points yield the same results

Caveat: texture filter precision

Filter kernel methods are expensive, but:

Tri-cubic B-spline kernels can be used in real-time (e.g., GPU Gems 2 Chapter "Fast Third-Order Filtering")

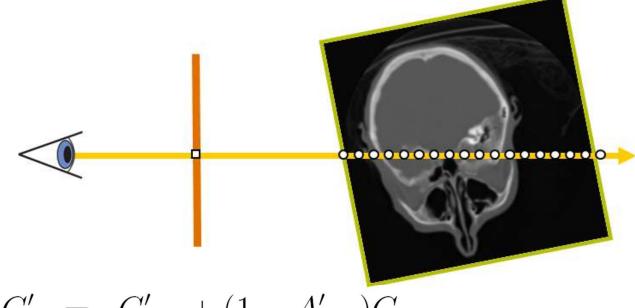

Ray setup

Loop over ray

Resample scalar value

Classification

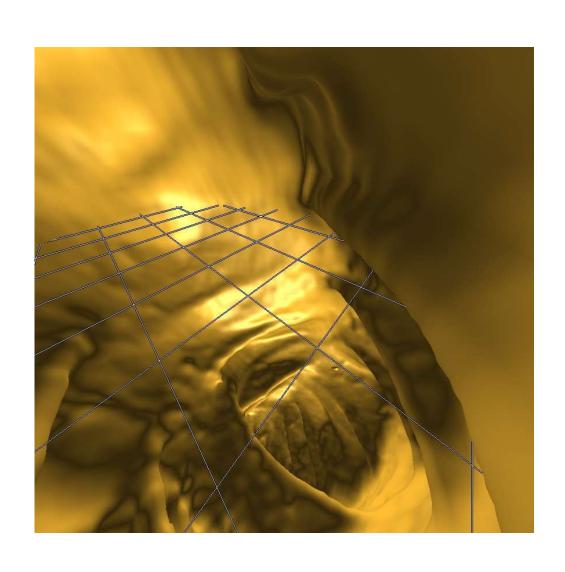

Shading

$$C'_{i} = C'_{i+1} + (1 - A'_{i+1})C_{i}$$

$$A_i' = A_{i+1}' + (1 - A_{i+1}')A_i$$

Fragment Shader

- Rasterize front faces of volume bounding box
- Texcoords are volume position in [0,1]
- Subtract camera position
- Repeatedly check for exit of bounding box

```
// Cg fragment shader code for single-pass ray casting
float4 main(VS_OUTPUT IN, float4 TexCoord0 : TEXCOORDO,
            uniform sampler3D SamplerDataVolume,
            uniform sampler1D SamplerTransferFunction,
            uniform float3 camera,
            uniform float stepsize,
            uniform float3 volExtentMin.
            uniform float3 volExtentMax
            ) : COLOR
   float4 value;
   float scalar;
   // Initialize accumulated color and opacity
   float4 dst = float4(0,0,0,0);
   // Determine volume entry position
   float3 position = TexCoord0.xyz;
   // Compute ray direction
   float3 direction = TexCoord0.xyz - camera;
   direction = normalize(direction);
   // Loop for ray traversal
   for (int i = 0; i < 200; i++) // Some large number
       // Data access to scalar value in 3D volume texture
       value = tex3D(SamplerDataVolume, position);
        scalar = value.a;
       // Apply transfer function
       float4 src = tex1D(SamplerTransferFunction, scalar);
       // Front-to-back compositing
       dst = (1.0-dst.a) * src + dst;
       // Advance ray position along ray direction
        position = position + direction * stepsize;
        // Ray termination: Test if outside volume ...
        float3 temp1 = sign(position - volExtentMin);
       float3 temp2 = sign(volExtentMax - position);
       float inside = dot(temp1, temp2);
       // ... and exit loop
        if (inside < 3.0)
            break:
   return dst;
```

CUDA Kernel

- Image-based ray setup
 - Ray start image
 - Direction image
- Ray-cast loop
 - Sample volume
 - Accumulate color and opacity
- Terminate
- Store output

```
void RayCastCUDAKernel( float *d_output_buffer, float *d_startpos_buffer, float *d_direction_buffer )
   // output pixel coordinates
   dword screencoord x = umul24( blockIdx.x, blockDim.x ) + threadIdx.x;
   dword screencoord y = umu124( blockIdx.y, blockDim.y ) + threadIdx.y;
   // target pixel (RGBA-tuple) index
    dword screencoord indx = ( umul24( screencoord y, cu screensize.x ) + screencoord x ) * 4;
   // get direction vector and ray start
   float4 dir vec = d direction buffer[ screencoord indx ];
   float4 startpos = d_startpos_buffer[ screencoord_indx ];
   // ray-casting loop
   float4 color
                    = make float4( 0.0f );
   float poscount = 0.0f;
    for ( int i = 0; i < 8192; i++ ) {
       // next sample position in volume space
       float3 samplepos = dir vec * poscount + startpos;
        poscount += cu_sampling_distance;
       // fetch density
       float tex density = tex3D( cu volume texture, samplepos.x, samplepos.y, samplepos.z);
       // apply transfer function
       float4 col classified = tex1D( cu transfer function texture, tex density );
       // compute (1-previous.a) *tf.a
       float prev alpha = -color.w * col classified.w + col classified.w;
       // composite color and alpha
       color.xyz = prev alpha * col classified.xyz + color.xyz;
       color.w += prev alpha;
       // break if ray terminates (behind exit position or alpha threshold reached)
        if ( ( poscount > dir vec.w ) || ( color.w > 0.98f ) ) {
           break;
   // store output color and opacity
   d output buffer[ screencoord indx ] = saturatef( color );
```

Thank you.
